## Analisis dan Diskusi

| Langkah | Jawaban/Deskripsi                                                                                                                                                                                                                                   |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1       | <p><b>relationship()</b> vs <b>options()</b></p> <ul style="list-style-type: none"><li><b>relationship()</b>: Otomatis mengambil data dari <b>tabel database lain</b>. Filament mengurus penarikan data dan penyimpanan ID secara cerdas.</li></ul> |

|   |                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   | <ul style="list-style-type: none"><li>● <b>options()</b>: Menggunakan <b>array statis</b> yang kamu tulis manual (misal: <code>['draft' =&gt; 'Draft', 'published' =&gt; 'Published']</code>).<br/>Tidak fleksibel jika data sering berubah.</li></ul>                                                                                                                                                                  |
| 2 | <p><b>Mengapa <b>searchable()</b> Penting untuk Dataset Besar?</b></p> <ul style="list-style-type: none"><li>● <b>Kecepatan Navigasi</b>: User tidak mungkin melakukan <i>scrolling</i> ribuan baris untuk mencari satu data.</li><li>● <b>Query Database</b>: Saat diketik, database hanya mengambil baris yang relevan (menggunakan <b>WHERE LIKE</b>), sehingga beban render di browser jauh lebih ringan.</li></ul> |
| 3 | <p><b>Apa Fungsi Relationship Manager?</b></p> <p>Fitur ini memungkinkan kamu menampilkan dan mengelola <b>tabel terkait</b> langsung di dalam halaman <b>View</b> atau <b>Edit</b> data utama.</p> <ul style="list-style-type: none"><li>● <b>Contoh</b>: Di halaman Edit "Penulis", kamu bisa langsung menambah, mengedit, atau menghapus daftar "Buku" milik penulis tersebut tanpa pindah halaman.</li></ul>        |
| 4 | <p><b>Kapan Menggunakan <b>HasMany</b> dan <b>BelongsTo</b>?</b></p> <p>Ini tergantung pada struktur tabel (Foreign Key):</p> <ul style="list-style-type: none"><li>● <b>BelongsTo</b>: Gunakan pada model yang <b>menyimpan</b> ID tabel lain. (Contoh: Tabel <b>Buku</b> punya <b>author_id</b>, maka Buku <b>belongsTo</b> Author).</li></ul>                                                                        |
